Experiment worksheet

Name or pair (optional): _____ Date: _____

1. Prediction before results

For each prompt, predict what the implemented rules do and what you would prefer. Keep those answers separate.

Prompt	Rule prediction	Your preferred route and reason
Extract an email from a long event note	_____	_____
Prove it.	_____	_____
Translate the word prove into French	_____	_____

2. Objective before tuning

My quality metric: _____

My quality floor or utility formula: _____

Why this objective suits the application: _____

The supplied script uses synthetic pass rate minus mean assumed cost units. You may choose another objective, but state it before looking at test.

3. Development experiment

Use 12 DEV prompts, never the test prompts, to choose a threshold. From the code folder: python3 -m scripts.experiment. The script uses the teaching utility above. For your own objective, use the CLI on DEV and calculate your stated rule.

Threshold	DEV quality	Cost units	Router p95 ms	Objective value
0.2	_____	_____	_____	_____
0.4	_____	_____	_____	_____
0.6	_____	_____	_____	_____
0.8	_____	_____	_____	_____

My frozen threshold: _____ Reason: _____

STOP: freeze your choice before the next page. Similar or tied outcomes are a valid finding on a small set.

Experiment worksheet: evaluation

4. Held-out test

Evaluate the frozen choice once on 36 TEST prompts. Run the benchmark with --threshold followed by your chosen number and --out results/my-test. Compare with always-large on identical questions.

Metric	Always large	Frozen policy
Synthetic pass rate	_____	_____
Mean assumed cost units	_____	_____
Measured router p95 ms	_____	_____
Modeled end-to-end p95 ms	_____	_____

Paired quality difference and conditional bootstrap interval: _____

One failure example from requests.csv: _____

Is it a selection error or an answer failure after an appropriate route?

_____

5. Historical replay as a separate experiment

Run recorded mode with the frozen threshold. Record quality as human pairwise preference credit. Do not compare this percentage numerically with synthetic pass rate.

Always-large credit: _____ Frozen-policy credit: _____

One reason this differs from the synthetic teaching world: _____

_____

6. Claim and limitation

Write one sentence your evidence supports, with the mode and sample size:

_____

_____

Write one conclusion these results cannot establish:

_____

Evidence checklist: objective written first; policy frozen before test; paired prompts; unique-question sample count; overhead included; hypothetical costs labeled; historical preference separated from correctness.
